Verifone eCommerce Integration Checklist

This is a list of things to verify before a new eCommerce integration is set into production.

For all implementations

Make sure that:

- ☑ the webshop always selects a working payment node.
- ☑ the webshop can send special characters (e.g åäö).
- ☑ the response from the payment page is verified correct at the webshop.
- ☑ the implementation supports the latest interface version.
- ☑ the webshop handle different basket item amounts correct.
- ☑ the parameters that are sent to the payment page has the correct length and format.
- ☑ the parameters does not contain data that can be blocked in the application firewall (special strings, double encryptions, scripts, etc).

For implementations where webshops have their own order handling system

Make sure that:

- ☑ the status is set correct for payments that are successful, canceled or unknown.
- ☑ the delayed callback functionality works.
- ☑ the check status functionality works (server to server).
- ☑ the refund/partial refund functionality works (server to server).
- ☑ the debit/partial debit functionality works (server to server).
